1. CONFIDENTIALITY NOTICE

The public summary is non-disclosive and contains no proprietary algorithms, formulas, or executable code. It serves solely as an authorship record and conceptual overview of the system design philosophy. This document is a public-facing abstract and is distinct from the internal white paper, which includes full-stack architecture, code, and decision-logic in confidential sections not disclosed herein.

Redistribution, copying, or conceptual replication is strictly prohibited. All rights are reserved by the authors. The full white paper remains confidential and is not publicly available. Institutional requests for deeper review may be considered under strict legal and confidentiality measures and are evaluated on a case-by-case basis based on strategic alignment. Approval is not guaranteed, and all rights remain fully reserved by the authors.

2. CONTEXT & STRATEGIC INTENT

We are developing a risk-centric capital architecture engineered to compound convex returns through regime sensitive posture, antifragile system design, and Bayesian inference. This public summary formalizes the system's authorship and strategic intent, providing a high-level overview of its foundational principles and recursive governance philosophy.

While proprietary implementation details remain confidential, the architecture has been internally validated through non-disclosive robustness testing across diverse market environments. Engineered for institutional-grade deployment, the architecture reflects production-grade readiness, underscored by structural scenario modeling and feature-engineered data feedback loops aligned with real-world capital logic.

3. ARCHITECTURE & DESIGN PRINCIPLES

The modular portfolio architecture delivers a multi-component operating system designed to navigate regime shifts, volatility expansions, and structural entropy across market cycles. While conventional quantitative models may prioritize signal density, brute-force feature extraction, or data sprawl, the architecture is engineered around survival-oriented capital logic, constraint aware intelligence, and long-horizon contextual resilience.

Formulated independently from first principles, we apply a systems-engineering approach to inferential modeling and antifragility. Rather than adapting from third-party templates, it emphasizes signal sparsity in implementation, seeking to asymmetrically compound capital while preserving structural integrity and contextual persistence under uncertainty.

4. STRATEGIC HIGHLIGHTS

The following non-specific conceptual themes broadly characterize the philosophical and architectural foundations. These elements convey the system's directional logic and structural posture without revealing implementation details. No proprietary methods, mathematical frameworks, or algorithmic constructs are disclosed.

- Bayesian structural inference and entropy-aware classification
- Capital deployment logic anchored in constraint aware principles
- Structural gating to minimize drawdowns during volatility expansion
- Recursive governance with preservation of signal-to-noise integrity
- Congruence to neurocomputational survival-intelligence models

All mathematical formalisms, execution protocols, and proprietary signal structures are strictly withheld. This summary serves only to provide conceptual orientation suitable for professional documentation.

5. DOCUMENT DETAILS

Title:

A *Risk-Centric Portfolio Architecture for Convex Alpha*

Authors:

• Katsushi Arisaka – Professor of Physics & Engineering at UCLA / Delta Strategy Co.

• Syed Bashir Hydari – Columbia University / Quantitative Strat / Delta Strategy Co.

• Jeff Traister – Former Managing Director, Guggenheim Partners / Delta Strategy Co.

White Paper Status:

Private Circulation
